# Rodent Brush

the simple, cost effective solution

## Pest control in the Rail Industry

### The problem

Junction boxes and trackside ducting are warm dry places, irresistible to rodents. There are many points of access through which a determined rodent can squeeze and make a nest. Problems occur because rats love to chew. As they gnaw through the protective plastic casing they dangerously expose the vital signal cable. With a break in the signal control, whole sections of railway are put out of use until the fault can be located and repaired. This results in expensive engineering costs and causes train delays.

### The solution

Our specially designed Rodent Brush is easy to use, and incredibly effective. Tests prove rodents do not like the feel of Rodent Brush filament on their faces and whiskers.

In trackside ducting, Rodent Brush can be laid on top of the cables, filling the cavity and preventing rats from entering. In signal boxes and enclosures, Rodent Brush can be pushed into any gaps and spaces at the base of the compartment to act as a deterrent to inquisitive rats.

Unlike other forms of pest control, Rodent Brush can be easily removed for routine maintenance and then replaced for ongoing cable protection. Rodent brush can be exposed to all elements, allows air to circulate and water to drain away.

The result is protected cables that allow the signalling network to keep the trains moving.

### Tried and tested

**Rodent Brush** has been tested and approved by Network Rail for use as a deterrent to rodents in ducting containing signalling and/or telecommunications cable, and similar areas of the infrastructure.

Rodent brush fitted into trackside ducting

#### Features

- Simple to fit and remove for cable maintenance
- Fire retardant brush material and coated core wire
- Protective end caps

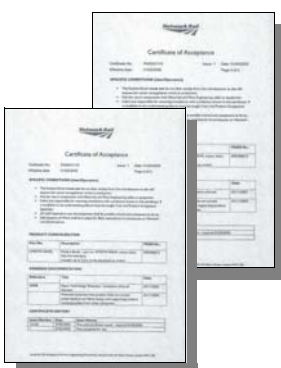

#### SPECIFICATION

Part number:	H795TW100HR
Standard length:	5000mm
Standard diameter:	100mm
Boxed quantity:	20 lengths

Guarding against rodent intrusion at the base of a trackside enclosure
